## 1 Lambda calculus syntax

Lambda calculus terms are variables, function applications, or function definitions:

$$M ::= v \mid (M M) \mid \lambda v. M$$

where “ $v$ ” represents a variable symbol.

Computation takes place by substituting in actual parameters for *free occurrences* of formal parameters, which are defined by induction on the structure of lambda calculus terms as follows:

**Definition 1.1** *If  $M$  is a term, then  $FV(M)$ , the collection of free variables of  $M$ , is defined as follows:*

1.  $FV(x) = \{ x \}$
2.  $FV(M N) = FV(M) \cup FV(N)$  *Lambe*
3.  $FV(\lambda v. M) = FV(M) - \{ v \}$

**Definition 1.2** *We write  $[N/x]M$  to denote the result of replacing all free occurrences of identifier  $x$  by  $N$  in expression  $M$ .*

1.  $[N/x]x \triangleq N$ ,
2.  $[N/x]y \triangleq y$ , *if  $y \neq x$ ,*
3.  $[N/x](L M) \triangleq ([N/x]L) ([N/x]M)$ ,
4.  $[N/x](\lambda y. M) \triangleq \lambda y. ([N/x]M)$ , *if  $y \neq x$  and  $y \notin FV(N)$ ,*
5.  $[N/x](\lambda x. M) \triangleq \lambda x. M$ .

## 2 Rules of Computation

**Definition 2.1** *The reduction rules for the lambda calculus are given by:*

$$(\alpha) \lambda x. M \xrightarrow{\alpha} \lambda y. ([y/x] M), \text{ if } y \notin \text{FV}(M).$$

$$(\beta) (\lambda x. M) N \xrightarrow{\beta} [N/x] M.$$

$$(\eta) \lambda x. (M x) \xrightarrow{\eta} M.$$
