# TRUST: A General Framework for Truthful Double Spectrum Auctions

Xia Zhou and Heather Zheng

Department of Computer Science, University of California, Santa Barbara

# Addressing Inefficient Spectrum Distribution

---

- ▶ Legacy wireless providers own the majority of spectrum

- ▶ But cannot fully utilize it

- ▶ New wireless providers are dying for usable spectrum

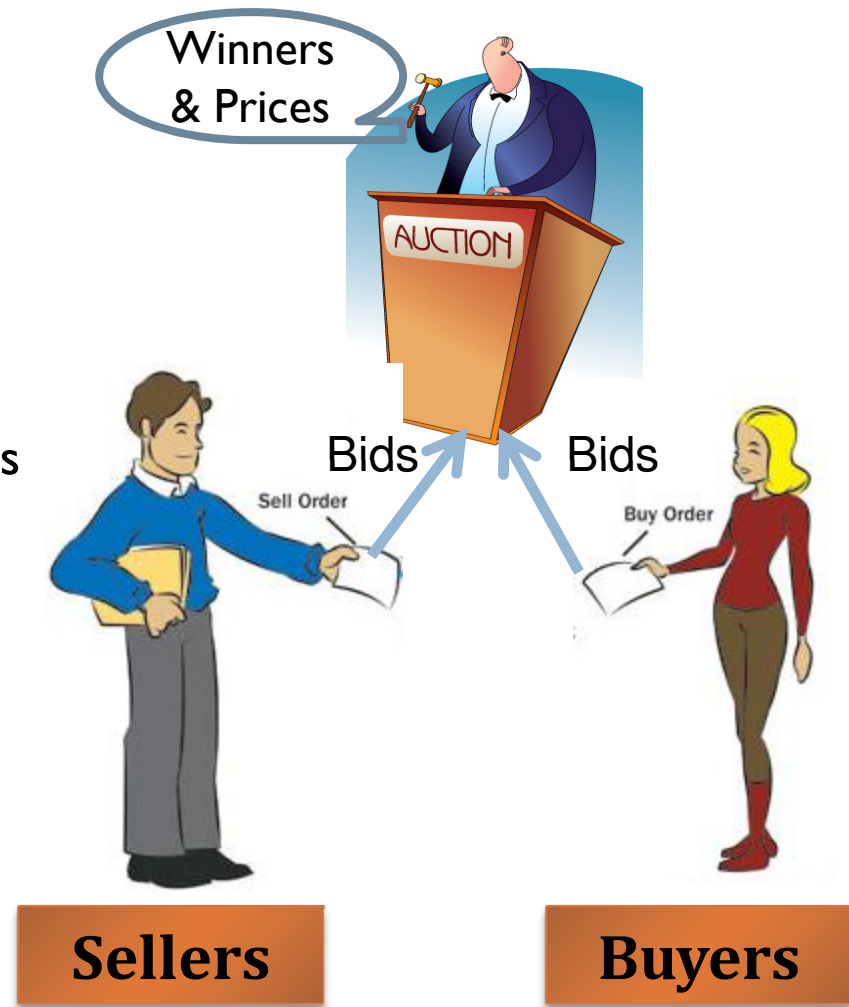

- ▶ But have to crowd into limited unlicensed bands

**Market-based Spectrum Trading**

# Enabling Trading by Double Auctions

- ▶ Double Auctions:
  - ▶ **Sellers** and **buyers** are bidders
    - ▶ Seller's bid: the minimal price it requires to sell a channel
    - ▶ Buyer's bid: the maximal price it is willing to pay for a channel
  - ▶ Auctioneer as the match maker
    - ▶ Select winning buyers and sellers

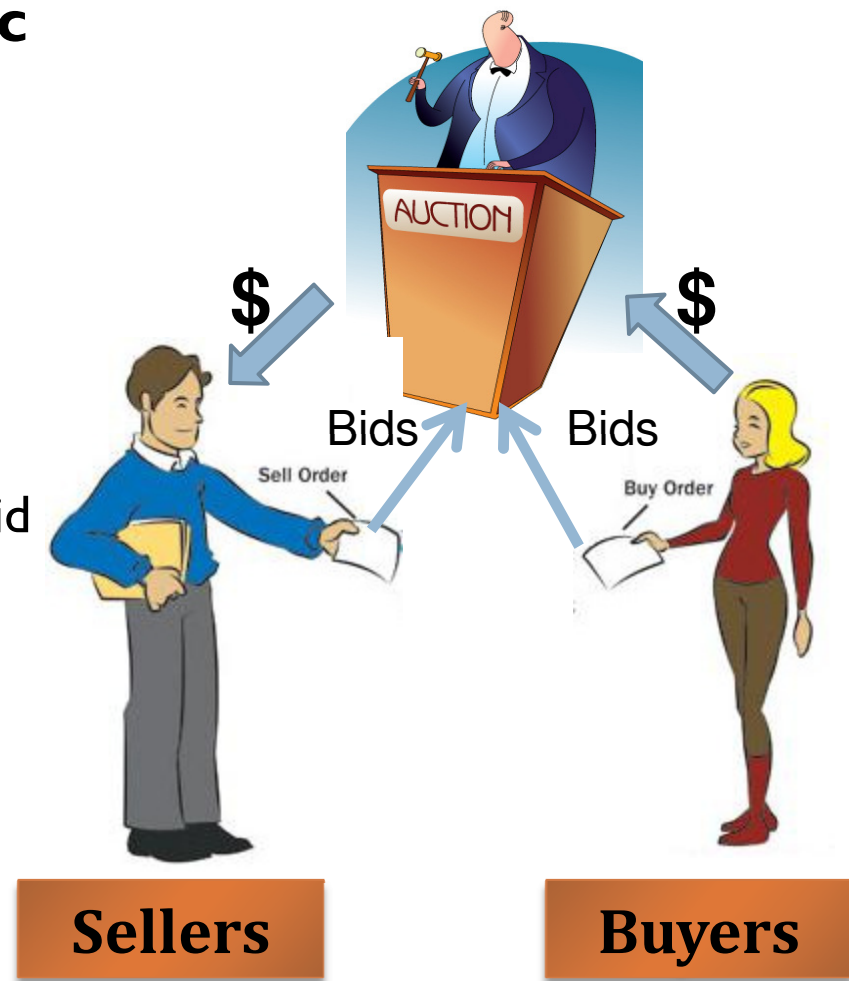

# Need Judicious Auction Designs

- ▶ **Need to achieve 3 economic properties**

- ▶ Budget balance: Payment to sellers  $\leq$  Charge to buyers
- ▶ Individual rationality:
  - ▶ Buyer pays less than its bid
  - ▶ Seller receives more than its bid
- ▶ Truthfulness: bid the true valuation

- ▶ **Need to provide efficient spectrum distribution**

# Our Contribution

---

- ▶ Enable **spectrum trading** by economic robust double auctions
- ▶ Achieving the three economic properties:
  - ▶ Budget balance
  - ▶ Individual rationality
  - ▶ Truthfulnesswhile trying to maximize spectrum efficiency
- ▶ **Achieve spectrum reuse among non-conflicting buyers**

# Outline

---

- ▶ Motivation of TRUST
- ▶ Challenges of enabling double spectrum auctions
- ▶ TRUST design & auction properties
- ▶ Evaluations
- ▶ Conclusions & Future extensions

# What Makes Double Spectrum Auctions Different?

---

- ▶ Must exploit spectrum reuse
  - ▶ One seller can support multiple buyers
- ▶ Traditional auction
  - ▶ 1 channel  $\rightarrow$  1 buyer
- ▶ Spectrum auction
  - ▶ 1 channel  $\rightarrow$  a set of buyers

# Existing Solutions No Longer Apply

---

	Truthfulness	Individual Rationality	Budget Balance	Spectrum Reuse
McAfee's Double Auction	✓	✓	✓	✗
VCG Double Auction	✓	✓	✗	✗
Extension of Single-sided Truthful Auction	✗	✓	✓	✓
<b>Our Goal</b>	✓	✓	✓	✓

# Outline

---

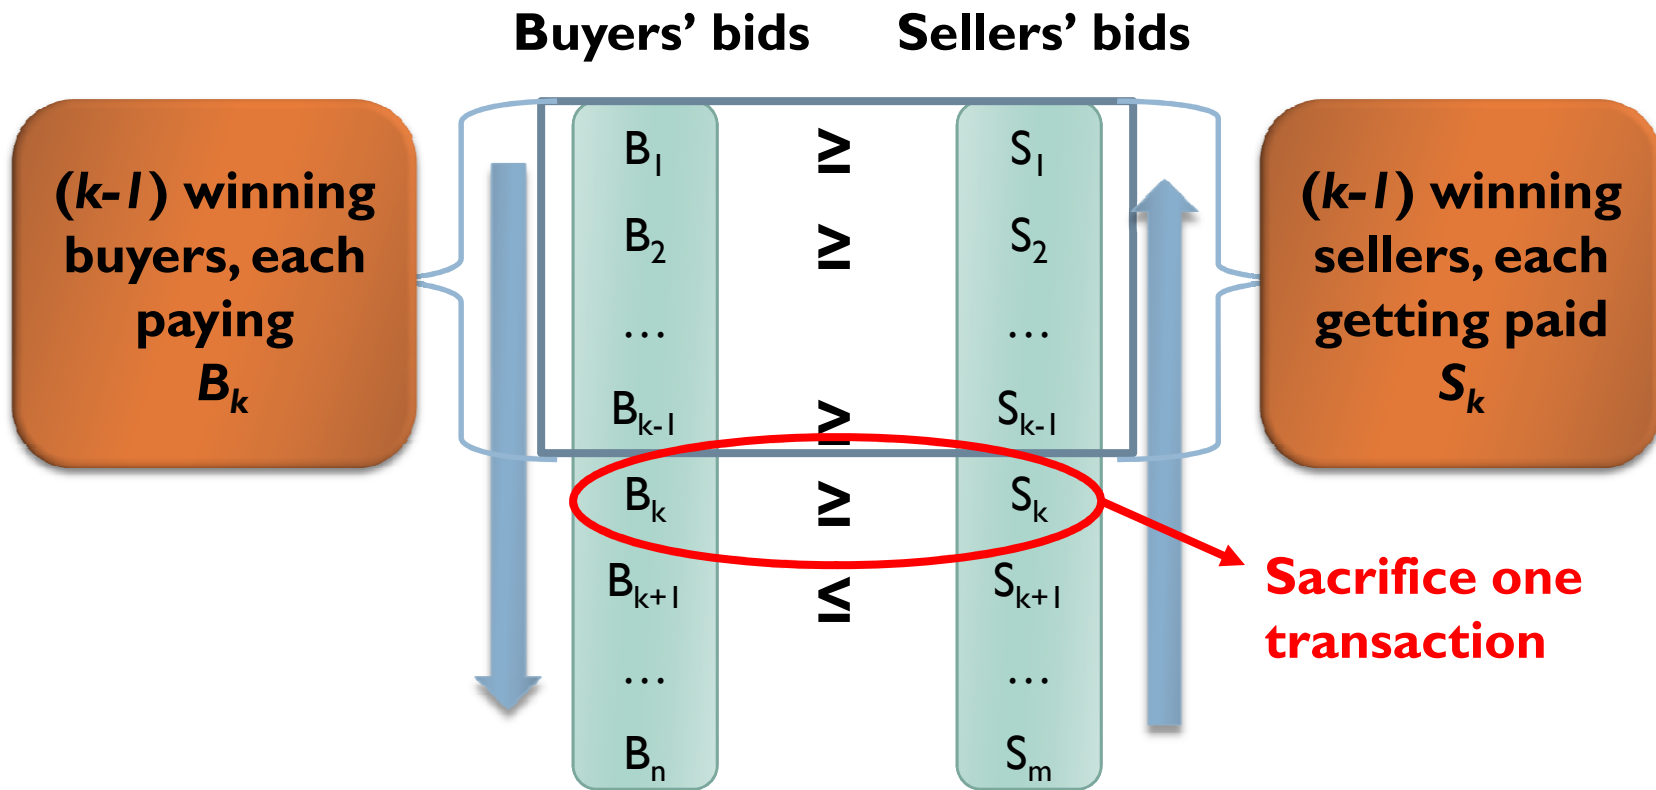

- ▶ Motivation of TRUST
- ▶ Challenges of enabling double spectrum auctions in practice
- ▶ **TRUST design & auction properties**
- ▶ Evaluations
- ▶ Conclusions & Future extensions

# Design Guidelines

---

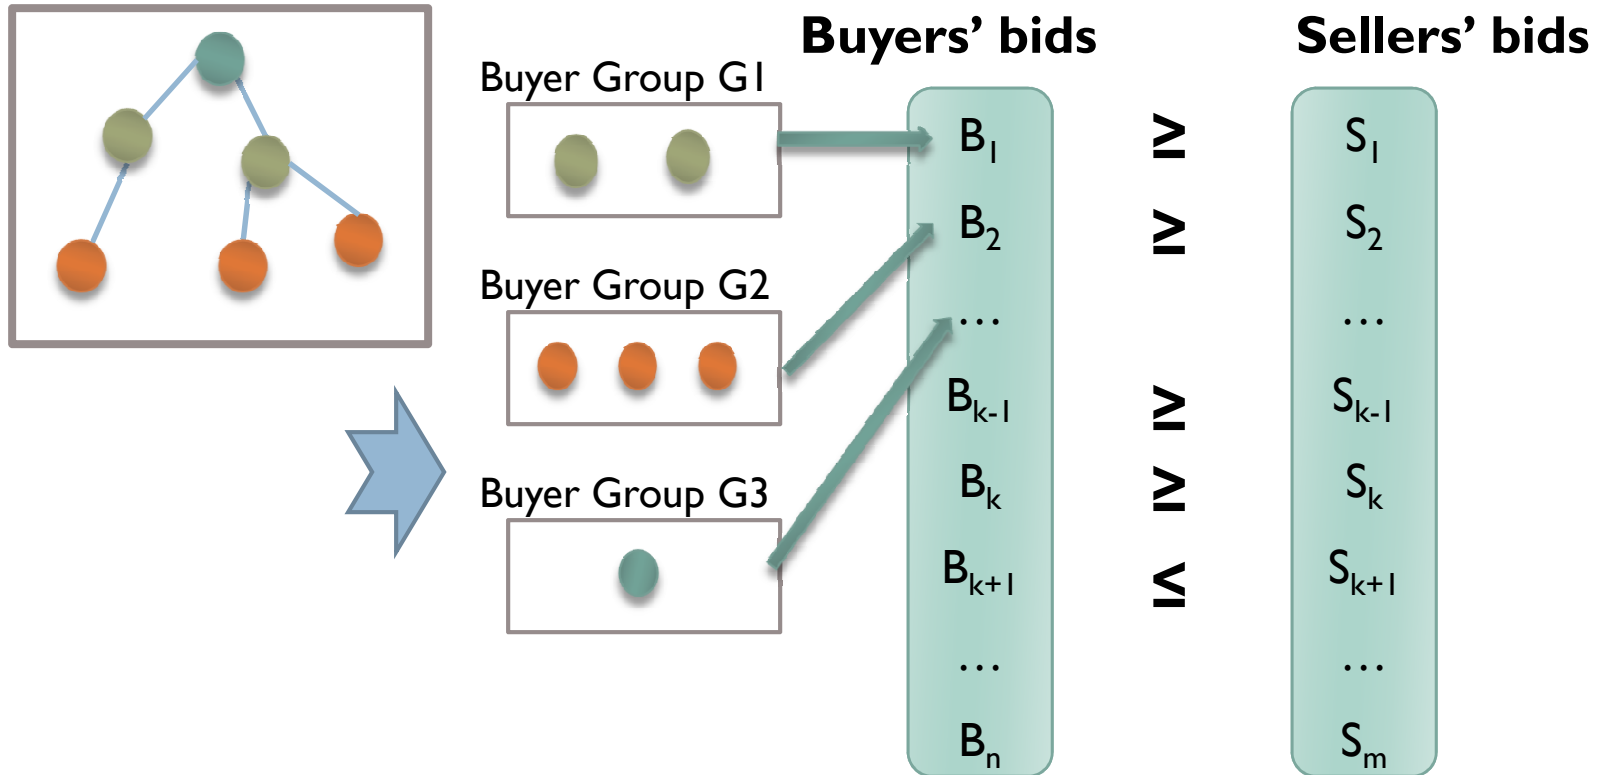

- ▶ Start from the McAfee design: the most popular truthful double auction design
  - ▶ Achieve all three economic properties without spectrum reuse
- ▶ Extend McAfee to assign multiple buyers to each single seller
  - ▶ Enable spectrum reuse among buyers
- ▶ Design the procedure judiciously to maintain the three economic properties

# McAfee Double Auction

- ▶ Achieve budget balance, truthfulness, individual rationality without spectrum reuse

# Enabling Spectrum Reuse

- ▶ Map a group of non-conflicting buyers to one seller

# TRUST: Design

Form buyer group

Decide the bid of each buyer group

Charge individuals in a winning buyer group

## Bid-independent Group Formation

1. Allocate one virtual channel to each buyer
2. Group buyers allocated with the same channel together

### Buyer groups

# TRUST: Design

Form buyer group

Decide the bid of each buyer group;  
Apply McAfee

Charge individuals in a  
winning buyer group

**Buyer group i's bid =**  
**The lowest bid in group i \* #of bidders in group i**

Buyer groups

\$4	\$5	\$8	\$3
\$2	\$4	\$6	\$4
\$3		\$3	\$5

Sellers' bids

Winning group

# TRUST: Design

Form buyer group

Decide the bid of each buyer group;  
Apply McAfee

Charge individuals in a  
winning buyer group

Uniform pricing within one winning buyer group

Buyer groups

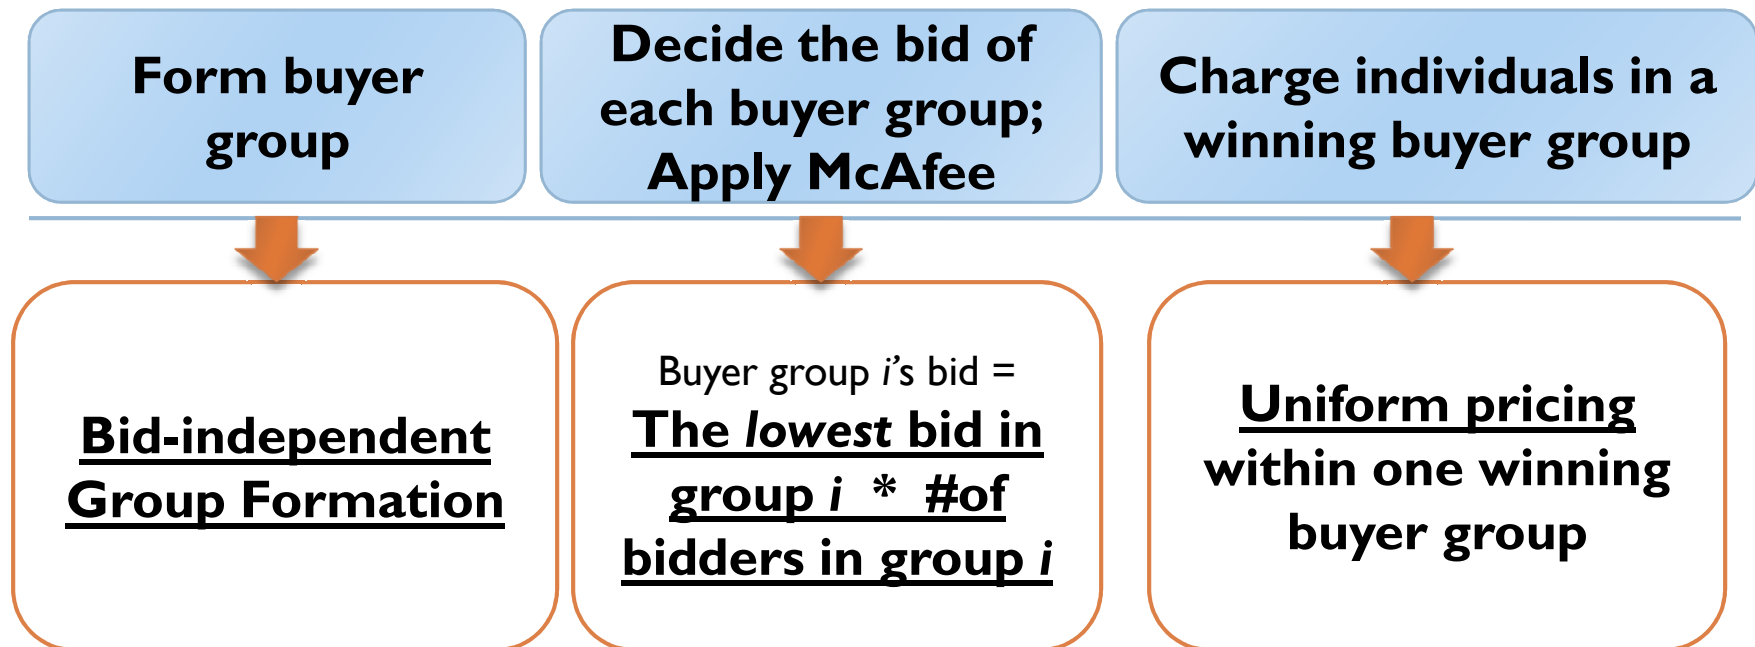

Sellers' bids

Winning group

\$4	\$5	\$8	\$3
\$2	\$4	\$6	\$4
\$3		\$3	\$5

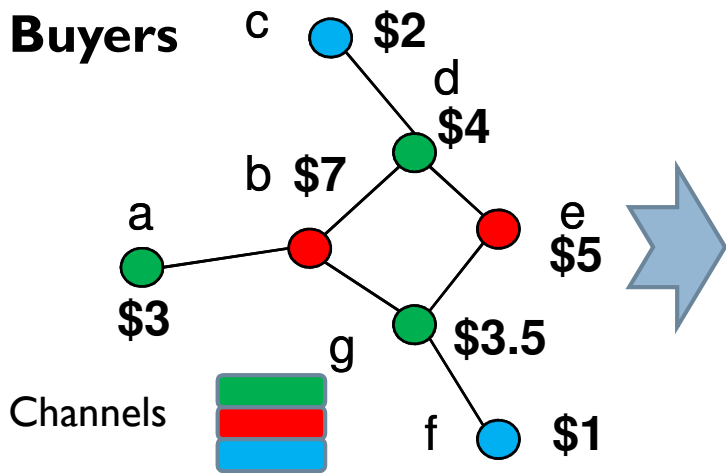

# TRUST: Auction Properties

**Theorem 1. TRUST is ex-post budget balanced, individual rational, and truthful.**

# TRUST: Example

**Buyer groups:**

--  $G1: \{b, e\} \rightarrow \$10$

--  $G2: \{a, d, g\} \rightarrow \$9$

--  $G3: \{c, f\} \rightarrow \$2$

**Sellers**

**Sellers' bids**

**Bids of buyer groups**

I: \$7	<b>Winners</b>	G1: \$10
II: \$8	<	G2: \$9
III: \$10	>	G3: \$2

**Seller I receives 8**

**Buyer b, e each pays 9/2**

# Outline

---

- ▶ Motivation of TRUST
- ▶ Challenges of enabling double spectrum auctions in practice
- ▶ TRUST design & auction properties
- ▶ **Evaluations**
- ▶ **Conclusions & Future extensions**

# TRUST: Evaluations

---

- ▶ Impact of **economics** on spectrum distribution
- ▶ Impact of **topologies of buyers**
- ▶ Impact of **bid patterns (variance)**

## Allocation Algorithms

- ▶ Max-IS
- ▶ Greedy-U
- ▶ Greedy
- ▶ RAND

## Topologies

- ▶ Random topology
- ▶ Cluster topology

## Bid Distribution

Bid  $b$  is generated by:

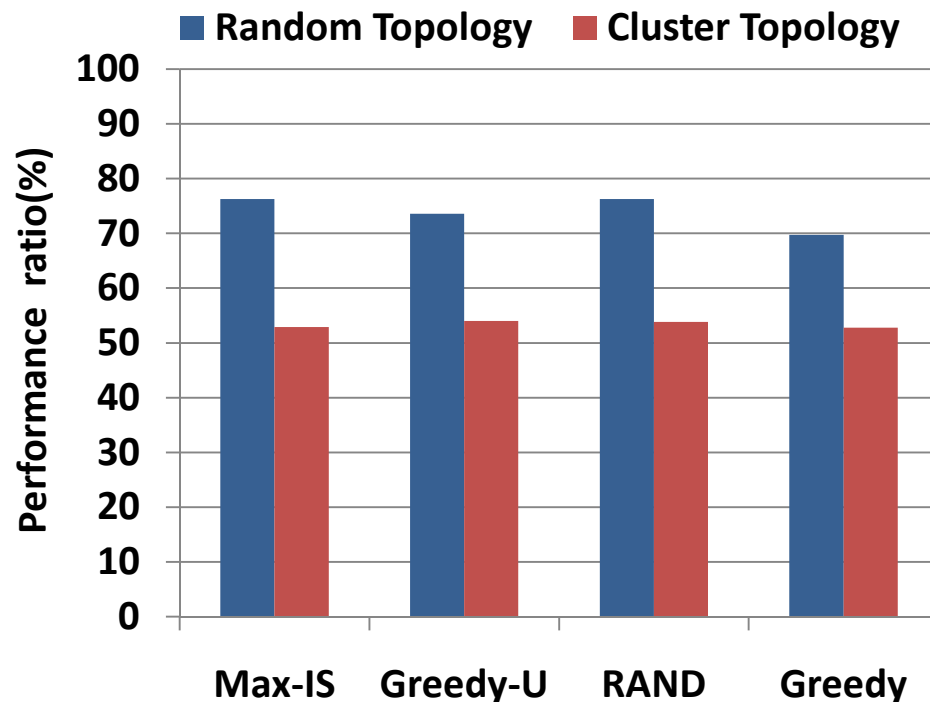

$$b = v \cdot \alpha + (1 - v)$$

- ▶  $v$  : range of variance
- ▶  $\alpha$ :  $\sim U[0, 1]$

# TRUST: Economic Impact

- ▶ Comparing to traditional spectrum allocation algorithms without economic factors, they choose groups by **sizes**

▶ Performance ratio = 
$$\frac{\text{Utilization of TRUST}}{\text{Utilization of spectrum allocations}}$$

- ▶ **TRUST chooses buyer group by the lowest bid \* group size**
- ▶ **In cluster topology, larger fraction of small groups, larger discrepancy in group sizes**

# Conclusions

---

- ▶ **Dynamic spectrum trading using double auctions**
  - ▶ The first work on truthful double spectrum auction while enabling spectrum reuse
    - ▶ Work with any spectrum allocation algorithm
  - ▶ Examine the impact of economic designs on spectrum distribution
    - ▶ Must tradeoff spectrum efficiency for economic robustness
- ▶ **Extensions**
  - ▶ Allow each bidders to buy / sell multiple channels
  - ▶ How the auctioneer obtains interference conditions
  - ▶ Achieve other economic properties i.e. collusion resistance

---

▶ Thank You!
